
CATZ-H Summary

Virginia • August 20th, 2007

This one would have been a complete wash-- except it never rained.

It was only envisioned as a small 3-site campaign because the forecast was not encouraging.

Only two of the sites were established, and only one of them acquired data.

As it was completely overcast all day, threatening rain, the only data acquired were measurements in the experimental 'cloud mode' called BCLSKY.

Rain gauges were on hand, but the threat of rain was ultimately an empty one.

The site that provided cloud data measurements was called Signal Hill.

It was located near Manassas, VA.
